

Design a Library Management System

We'll cover the following ^

- System Requirements
- Use case diagram
- Class diagram
- Activity diagrams
- Code

A Library Management System is a software built to handle the primary housekeeping functions of a library. Libraries rely on library management systems to manage asset collections as well as relationships with their members. Library management systems help libraries keep track of the books and their checkouts, as well as members' subscriptions and profiles.

Library management systems also involve maintaining the database for entering new books and recording books that have been borrowed with their respective due dates.

System Requirements

Always clarify requirements at the beginning of the interview. Be sure to ask questions to find the exact scope of the system that the interviewer has in mind.

We will focus on the following set of requirements while designing the Library Management System:

1. Any library member should be able to search books by their title, author, subject category as well by the publication date.
2. Each book will have a unique identification number and other details including a rack number which will help to physically locate the book.
3. There could be more than one copy of a book, and library members should be able to check-out and reserve any copy. We will call each copy of a book, a book item.
4. The system should be able to retrieve information like who took a particular book or what are the books checked-out by a specific library member.
5. There should be a maximum limit (5) on how many books a member can check-out.
6. There should be a maximum limit (10) on how many days a member can keep a book.
7. The system should be able to collect fines for books returned after the due date.
8. Members should be able to reserve books that are not currently available.

9. The system should be able to send notifications whenever the reserved books become available, as well as when the book is not returned within the due date.

10. Each book and member card will have a unique barcode. The system will be able to read barcodes from books and members' library cards.

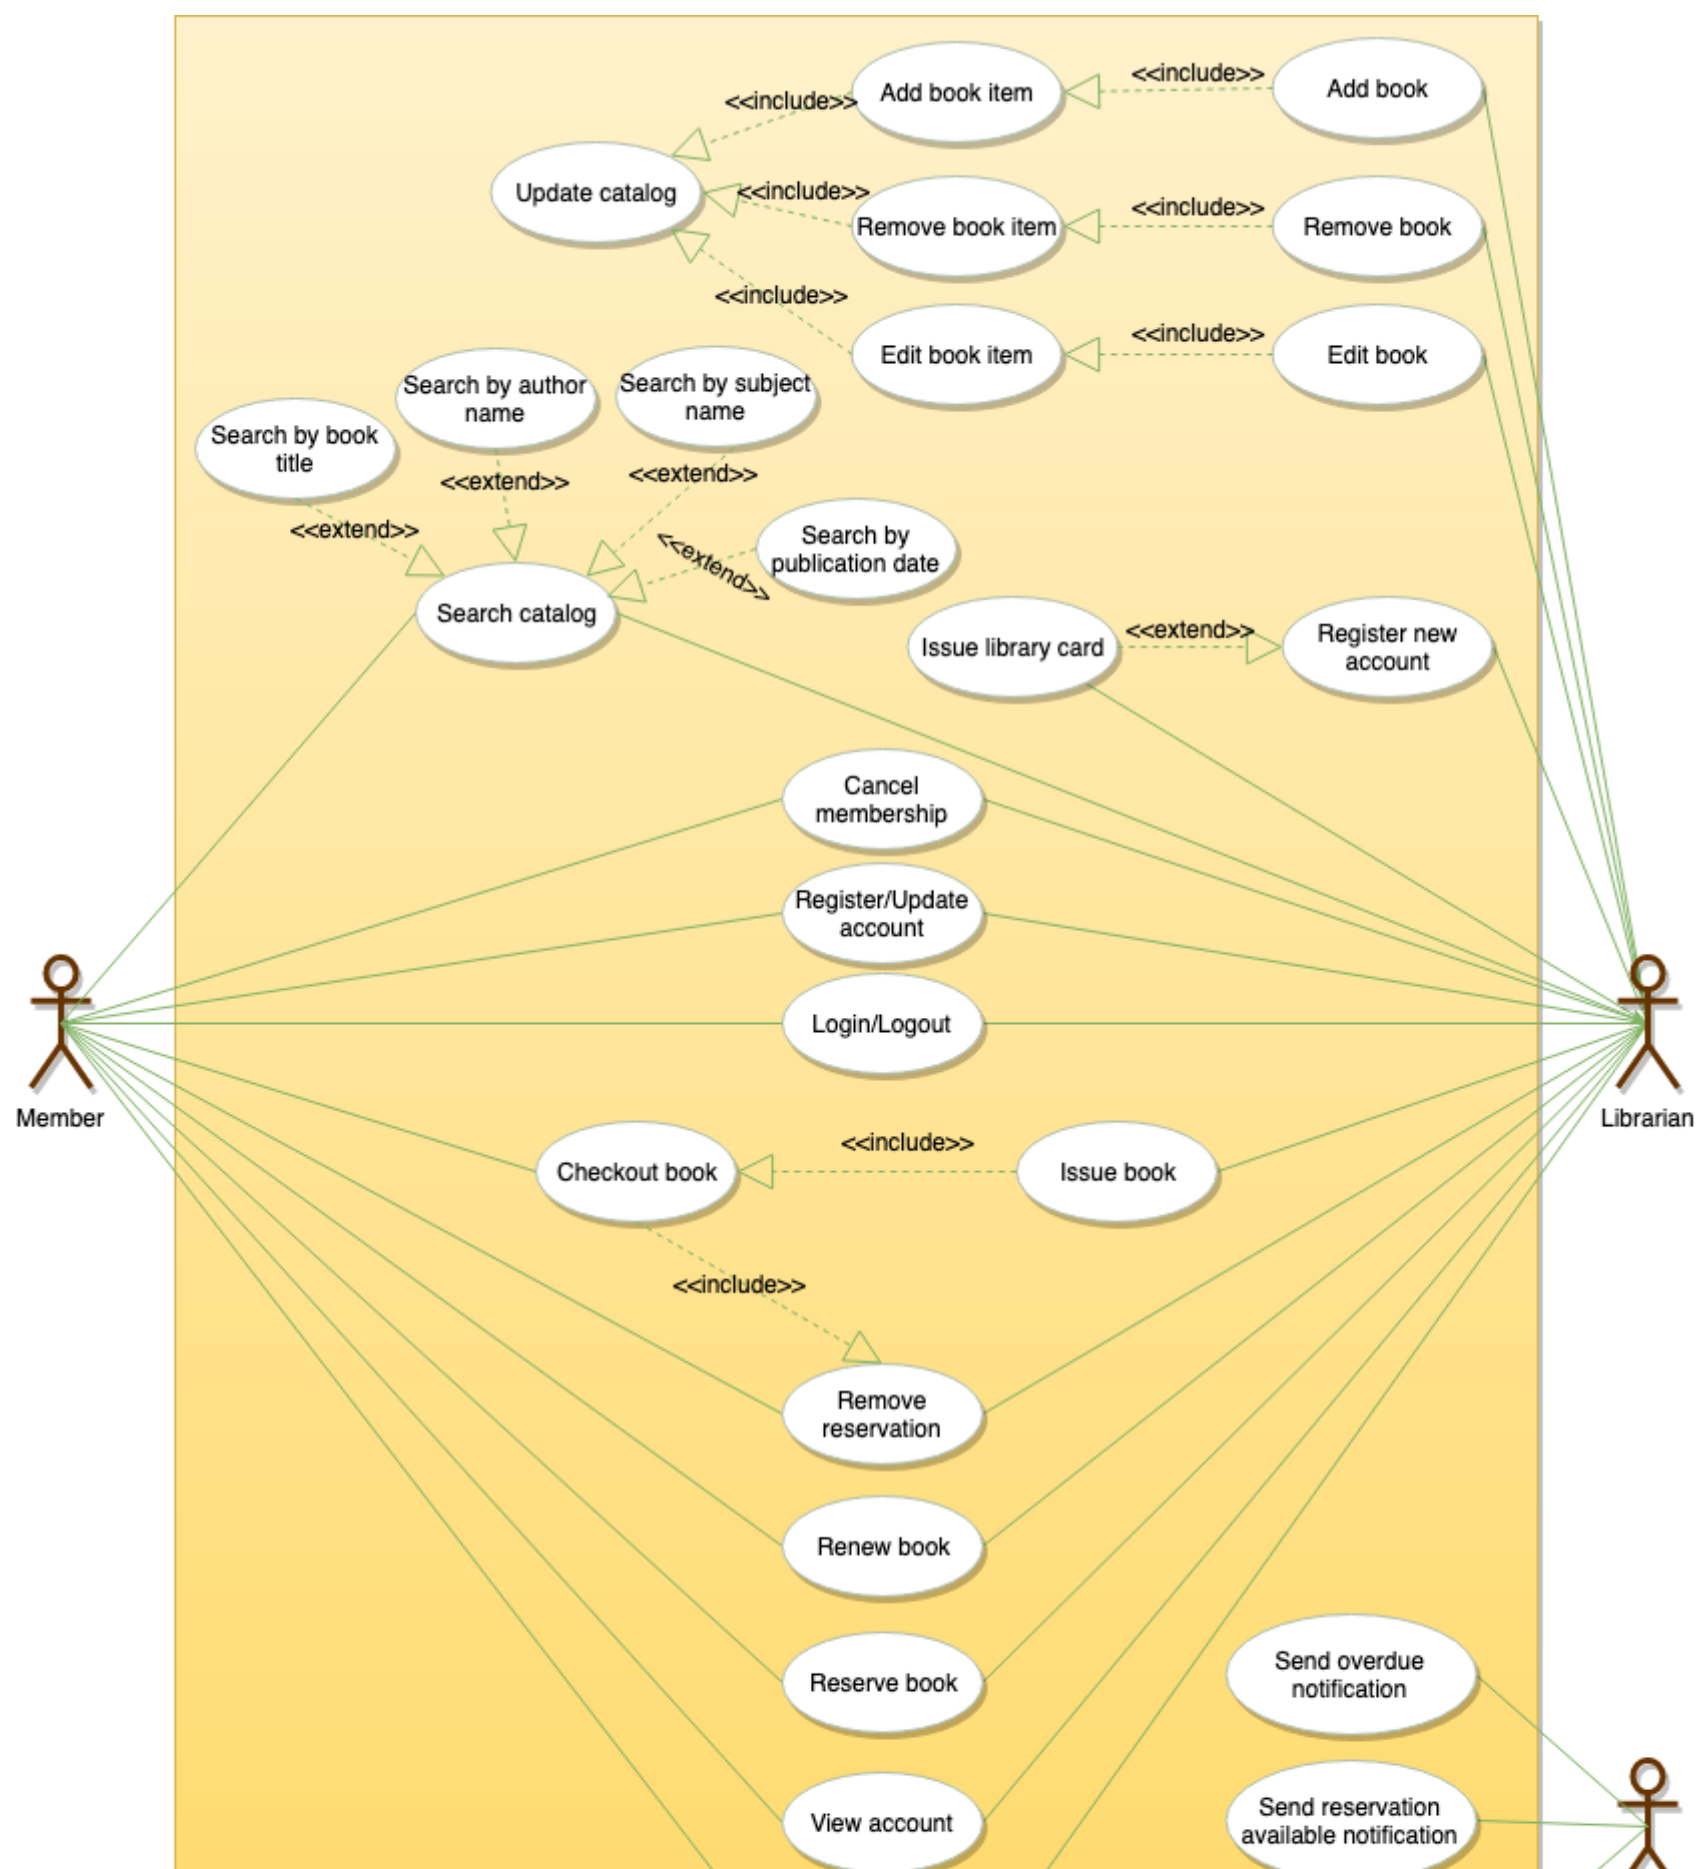

Use case diagram

We have three main actors in our system:

- **Librarian:** Mainly responsible for adding and modifying books, book items, and users. The Librarian can also issue, reserve, and return book items.
- **Member:** All members can search the catalog, as well as check-out, reserve, renew, and return a book.
- **System:** Mainly responsible for sending notifications for overdue books, canceled reservations, etc.

Here are the top use cases of the Library Management System:

- **Add/Remove/Edit book:** To add, remove or modify a book or book item.
- **Search catalog:** To search books by title, author, subject or publication date.
- **Register new account/cancel membership:** To add a new member or cancel the membership of an existing member.
- **Check-out book:** To borrow a book from the library.
- **Reserve book:** To reserve a book which is not currently available.
- **Renew a book:** To reborrow an already checked-out book.
- **Return a book:** To return a book to the library which was issued to a member.

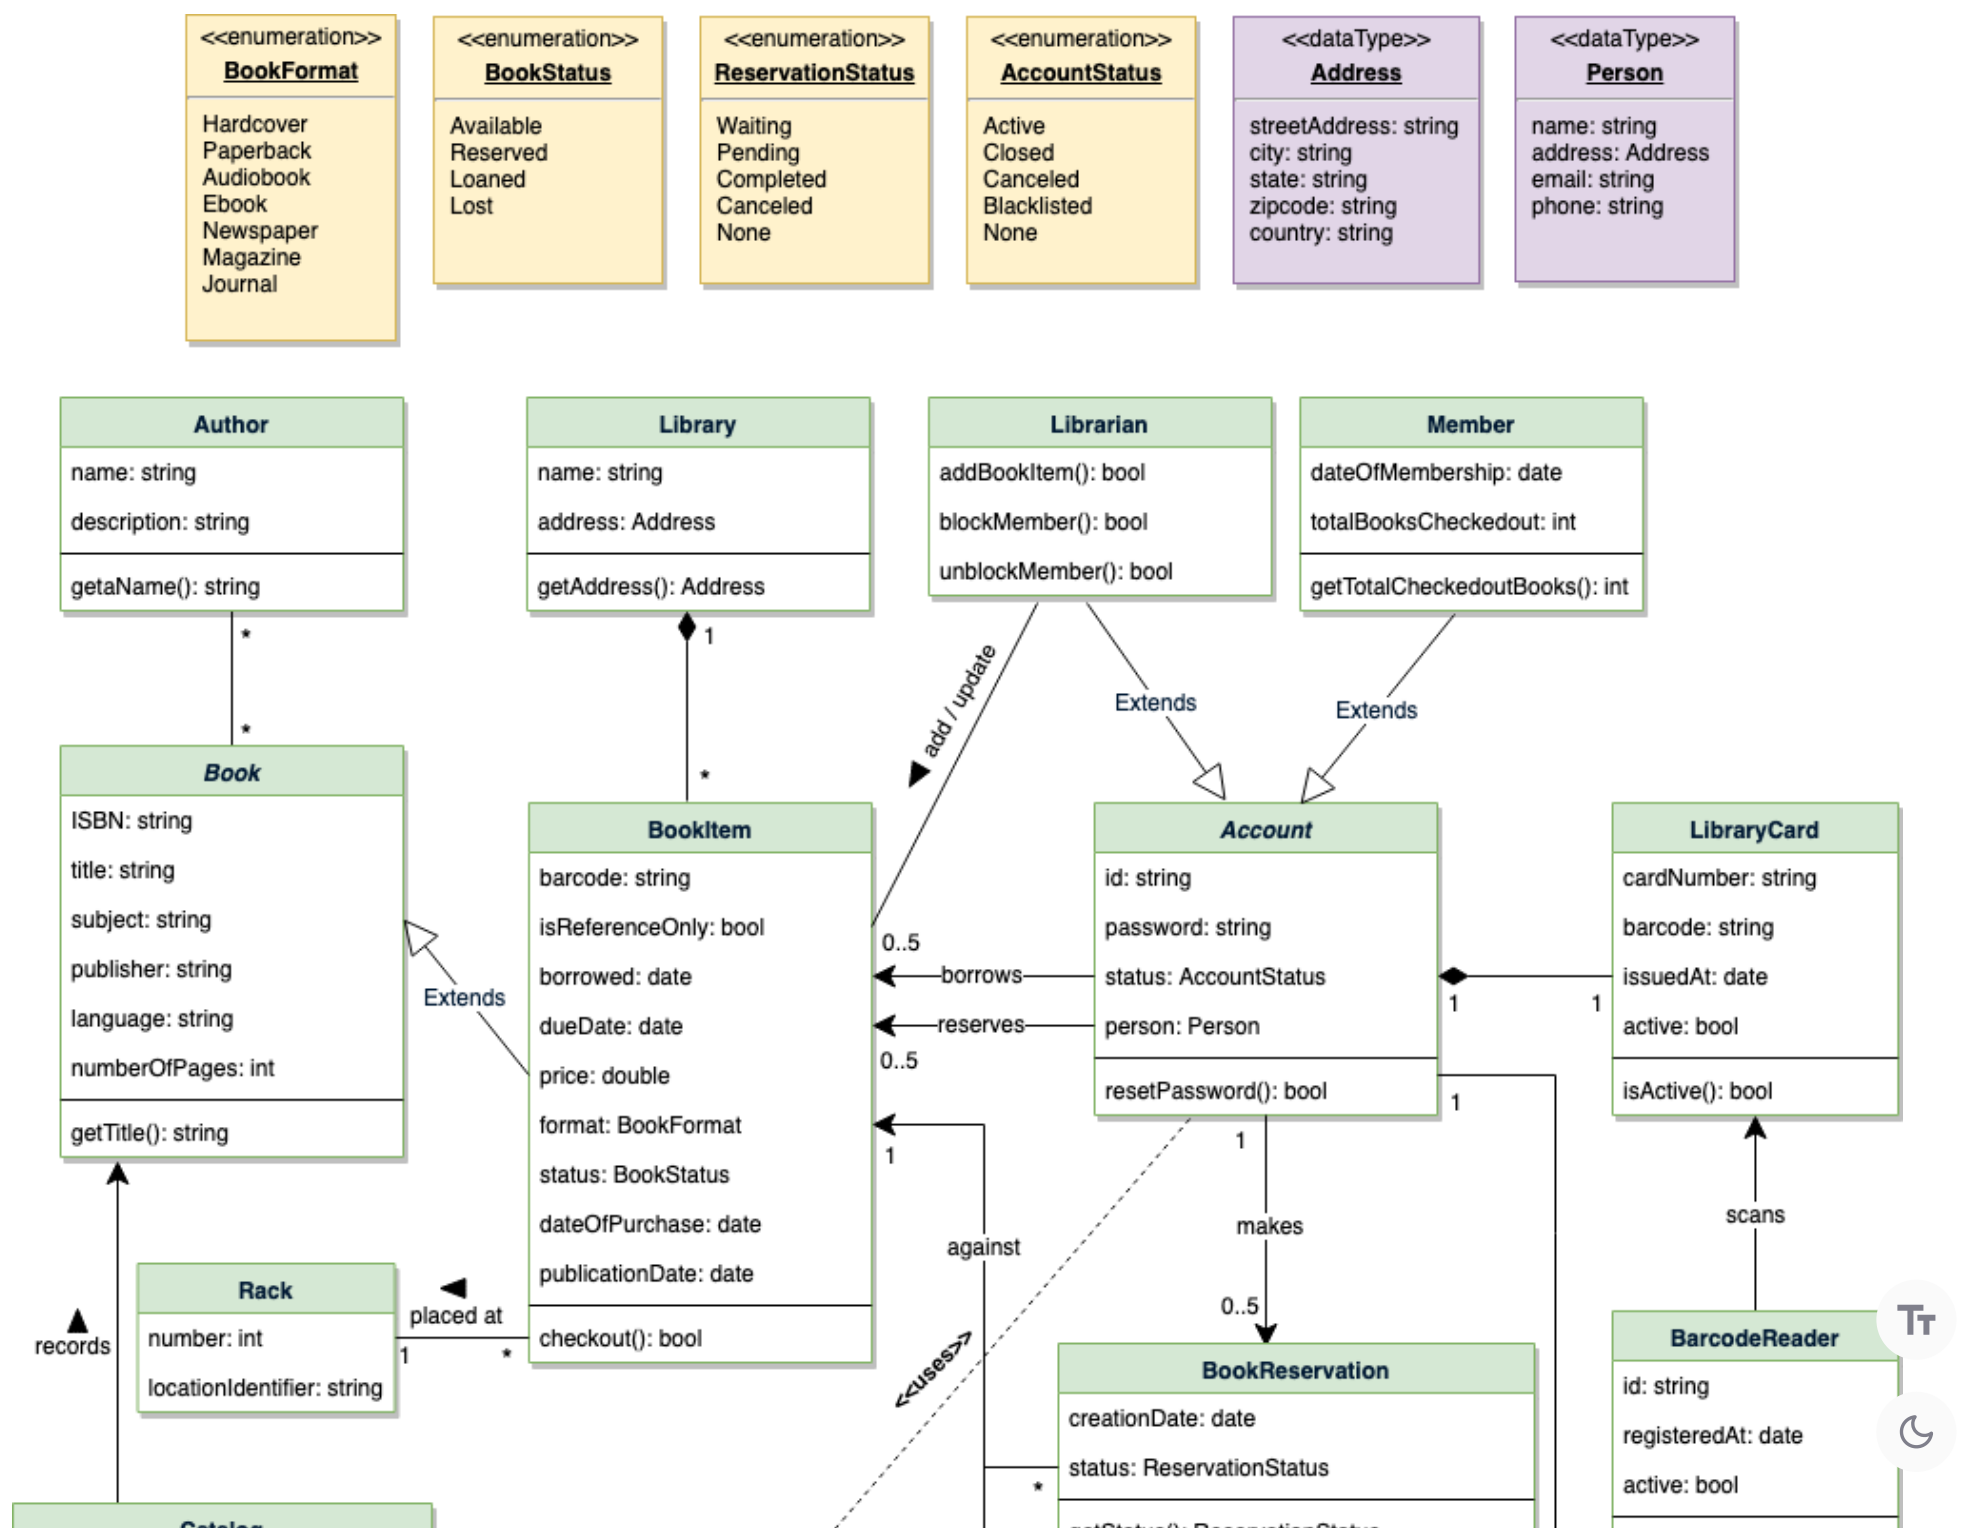

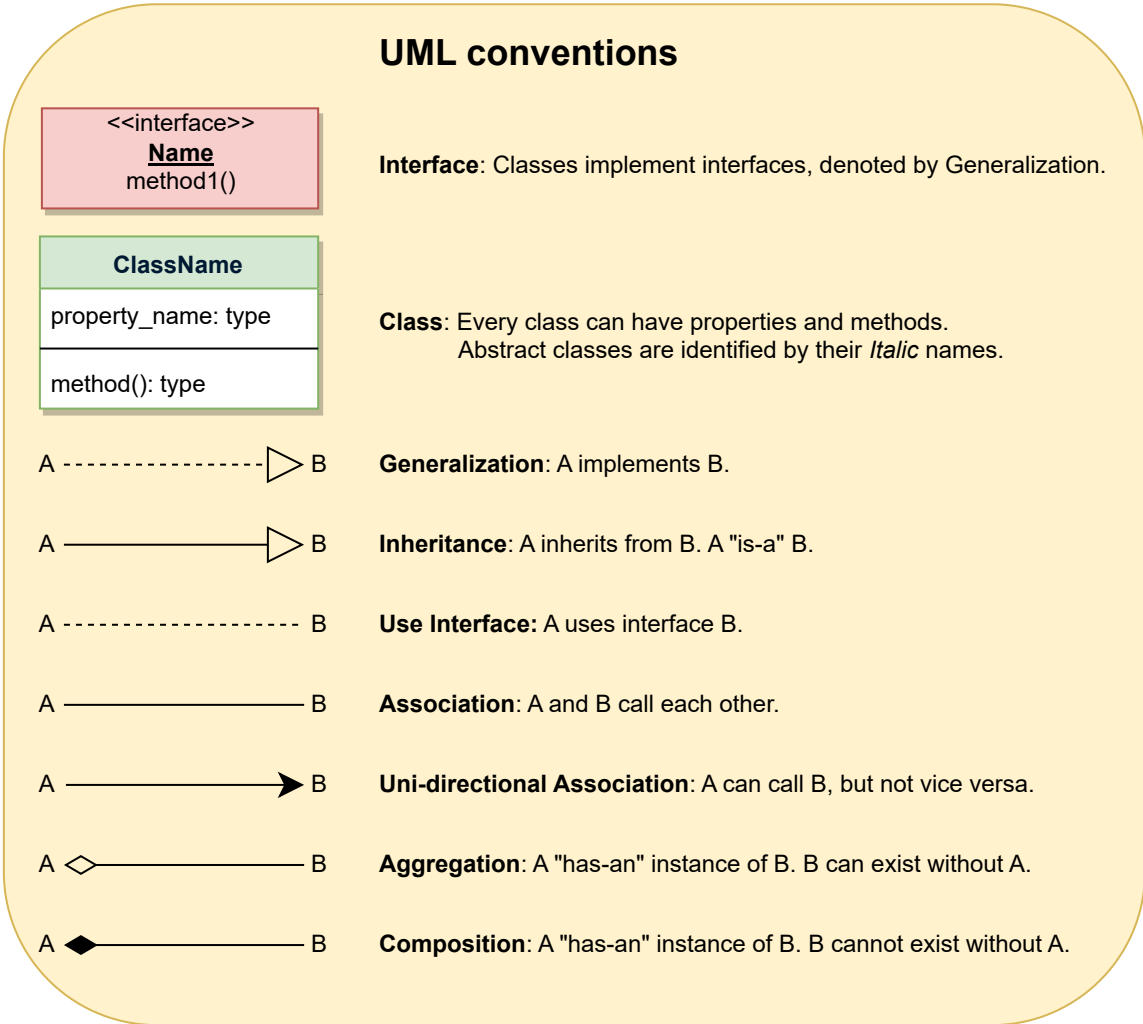

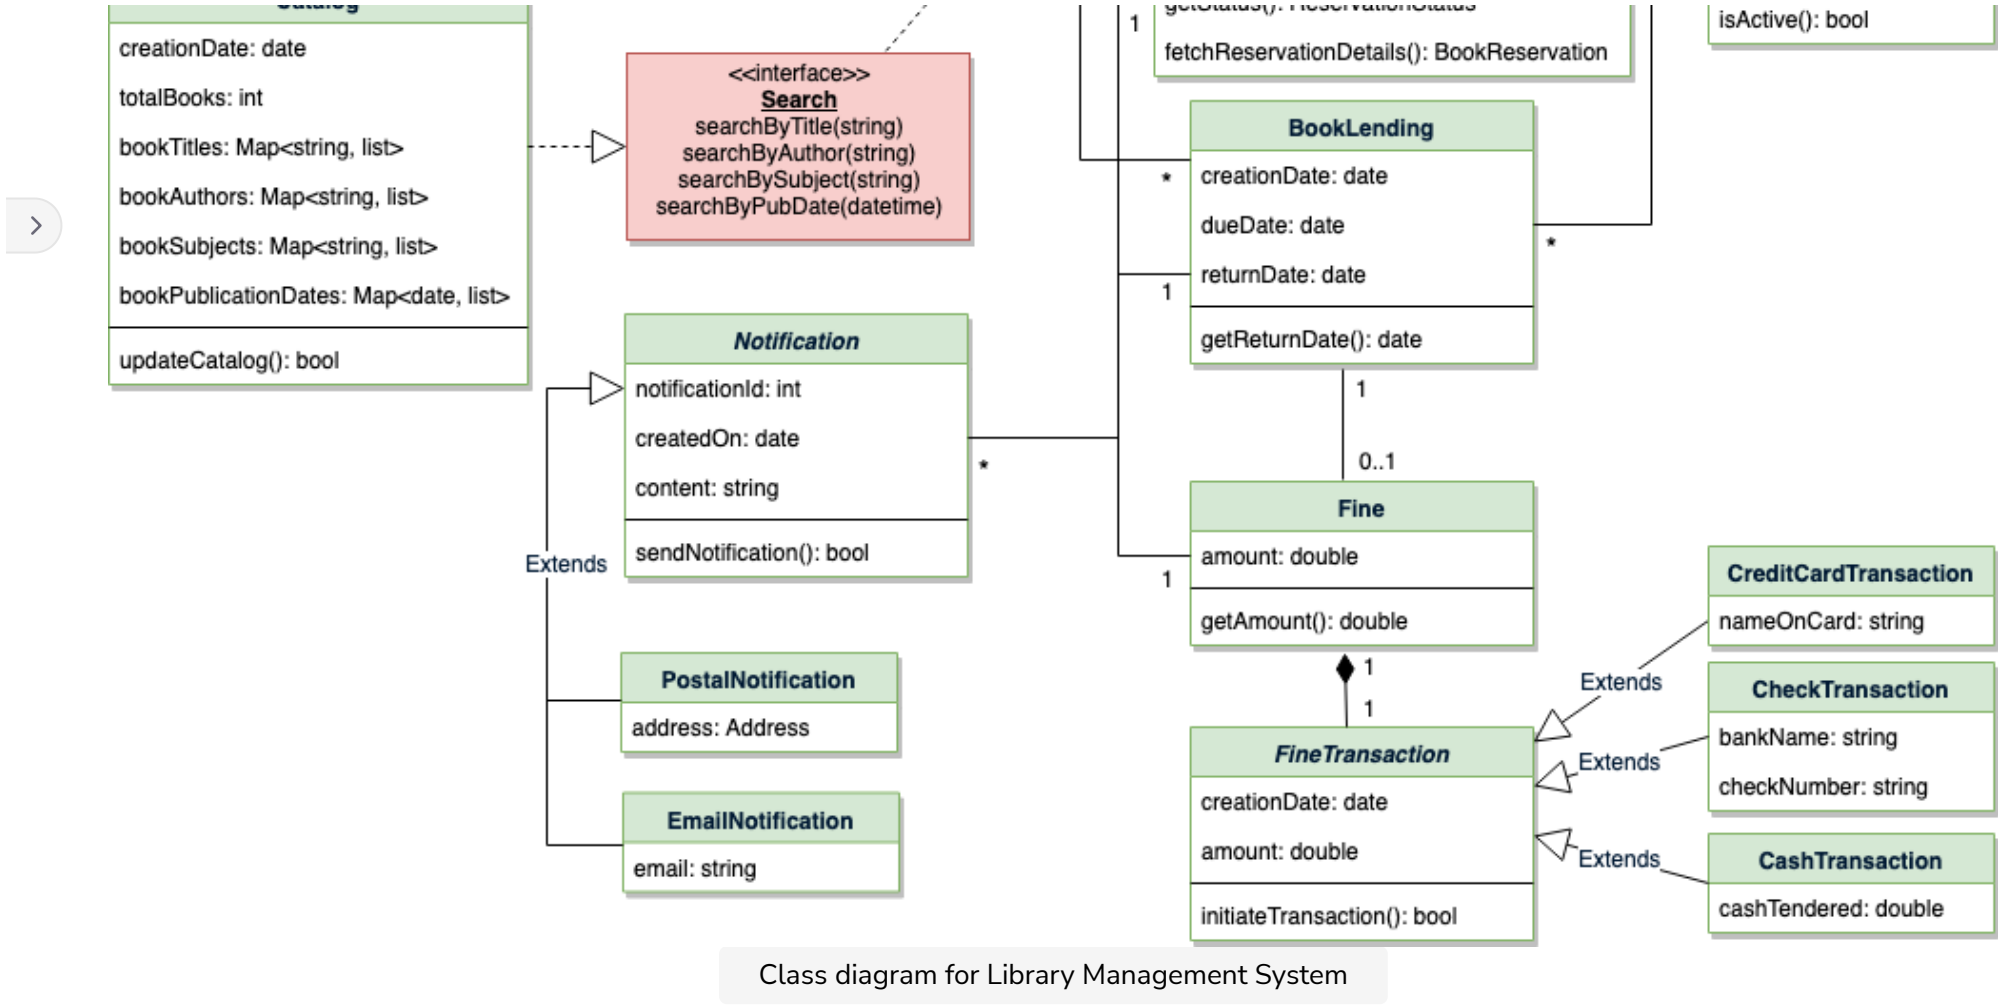

Use case diagram

Class diagram

Here are the main classes of our Library Management System:

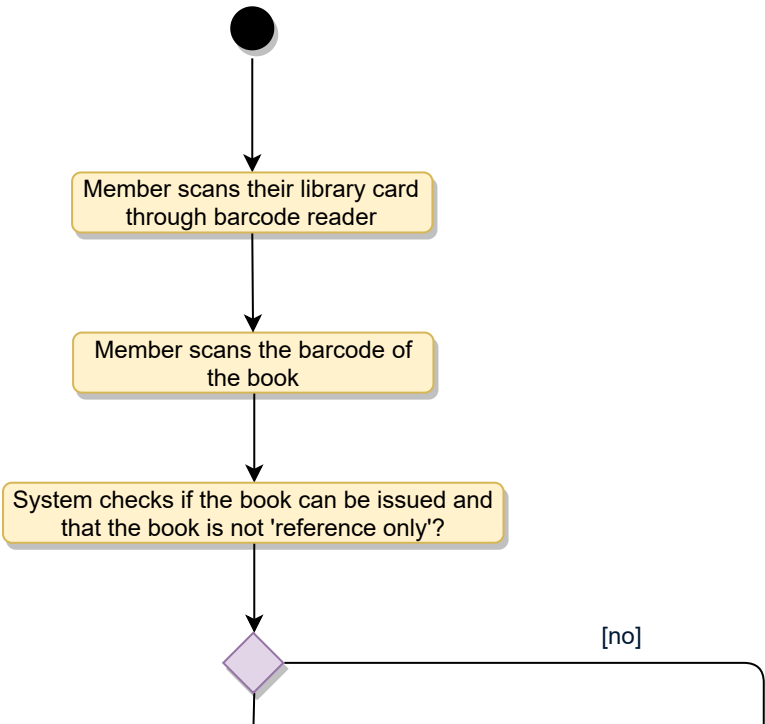

- **Library:** The central part of the organization for which this software has been designed. It has attributes like 'Name' to distinguish it from any other libraries and 'Address' to describe its location.
- **Book:** The basic building block of the system. Every book will have ISBN, Title, Subject, Publishers, etc.
- **BookItem:** Any book can have multiple copies, each copy will be considered a book item in our system. Each book item will have a unique barcode.
- **Account:** We will have two types of accounts in the system, one will be a general member, and the other will be a librarian.
- **LibraryCard:** Each library user will be issued a library card, which will be used to identify users while issuing or returning books.
- **BookReservation:** Responsible for managing reservations against book items.
- **BookLending:** Manage the checking-out of book items.
- **Catalog:** Catalogs contain list of books sorted on certain criteria. Our system will support searching through four catalogs: Title, Author, Subject, and Publish-date.
- **Fine:** This class will be responsible for calculating and collecting fines from library members.
- **Author:** This class will encapsulate a book author.
- **Rack:** Books will be placed on racks. Each rack will be identified by a rack number and will have a location identifier to describe the physical location of the rack in the library.
- **Notification:** This class will take care of sending notifications to library members.

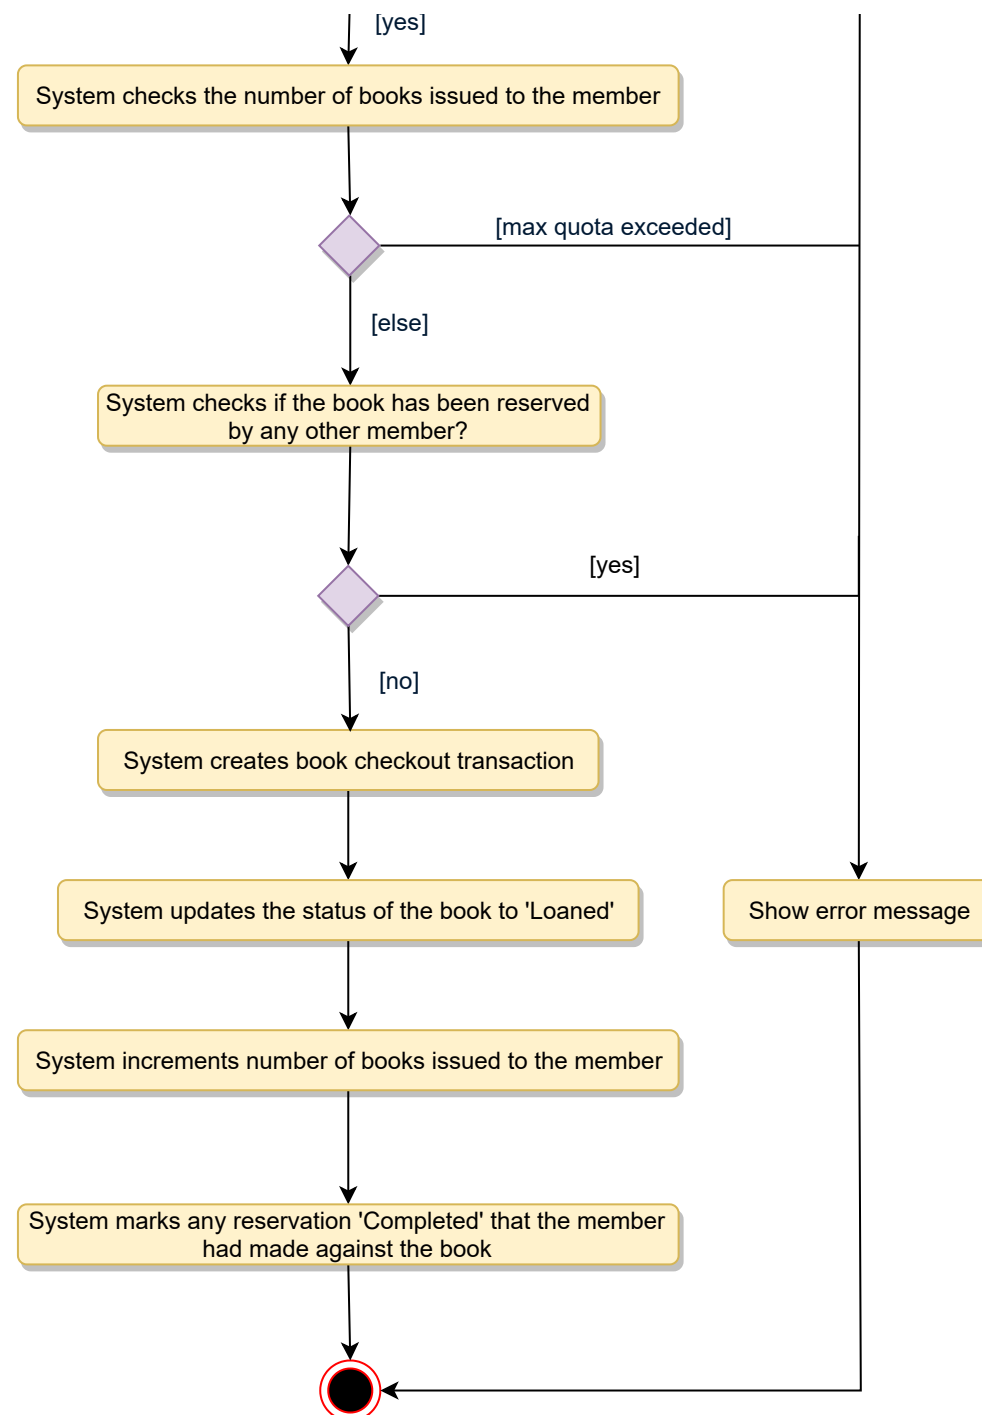

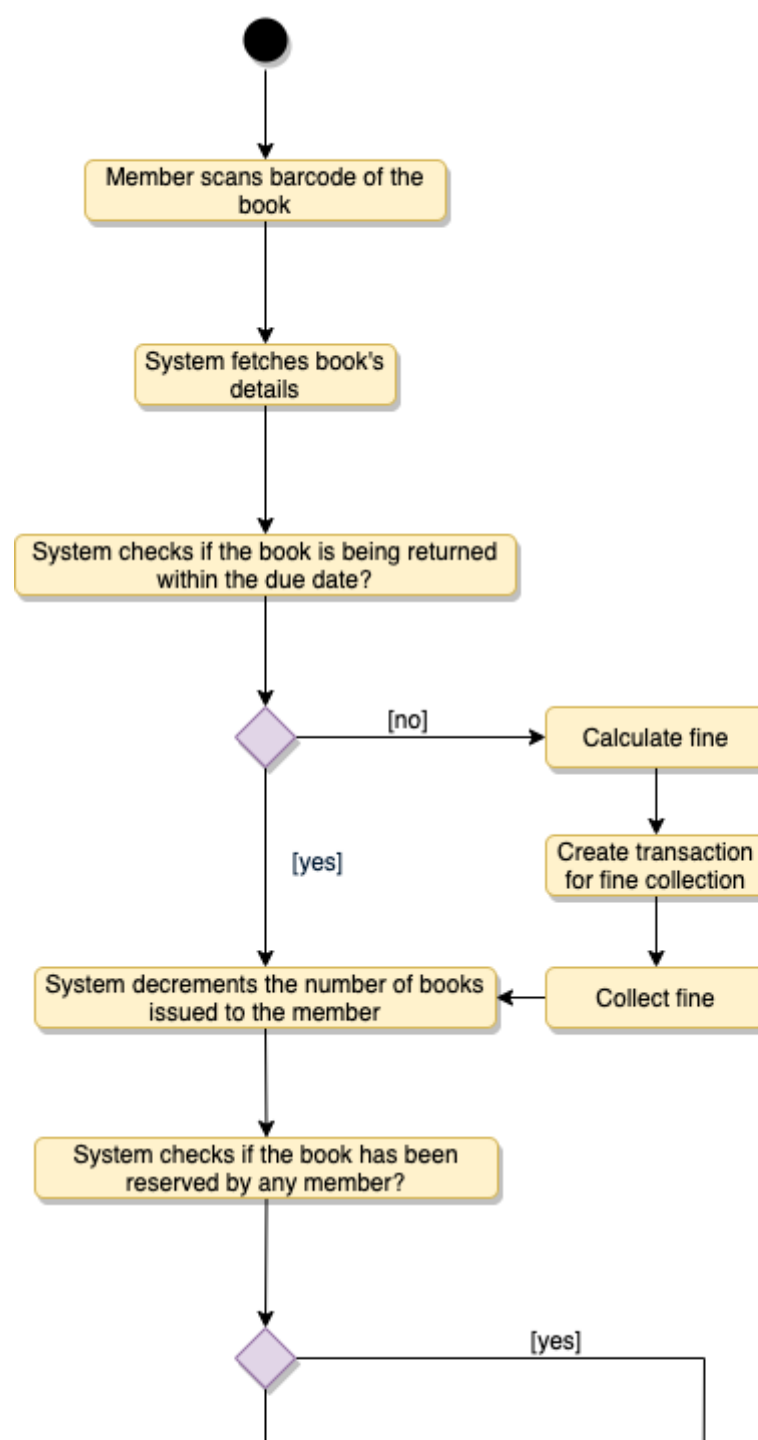

Activity diagrams

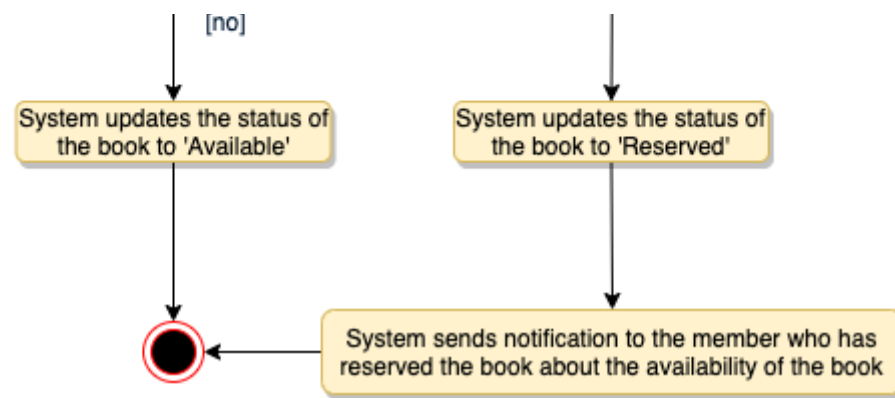

Check-out a book: Any library member or librarian can perform this activity. Here are the set of steps to check-out a book:

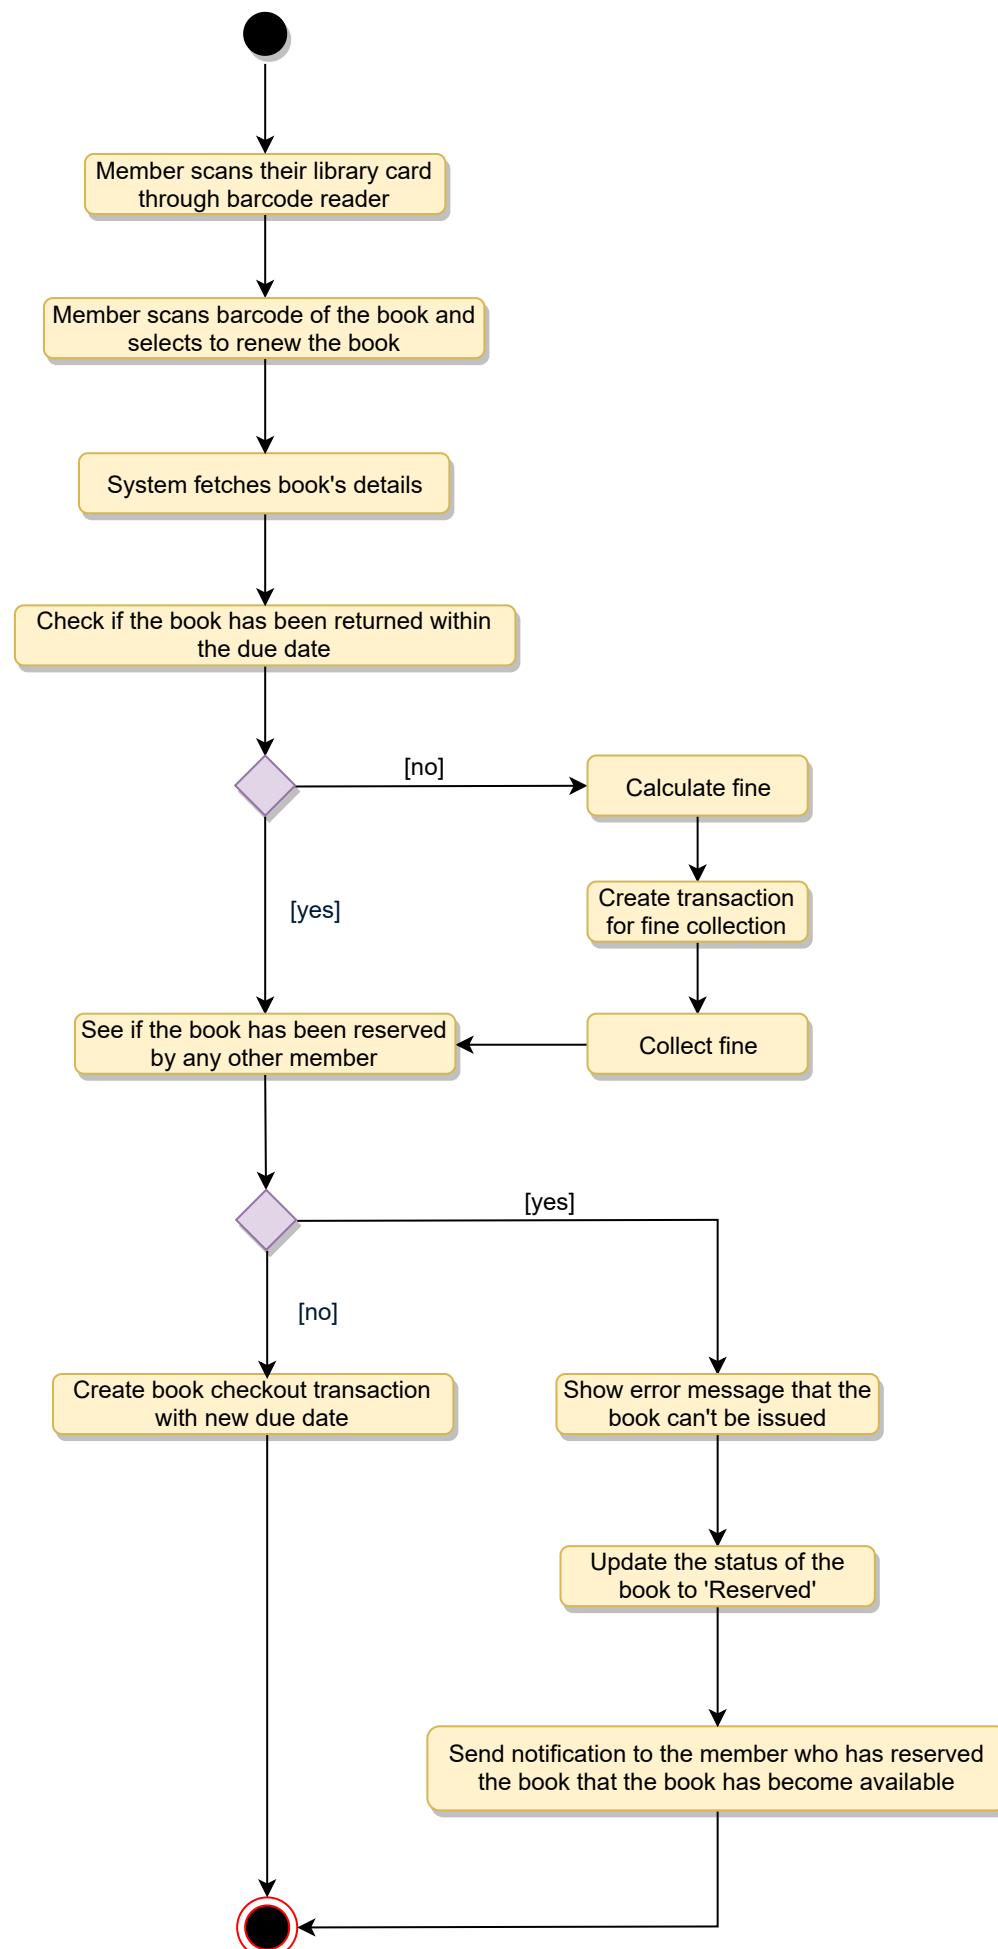

Return a book: Any library member or librarian can perform this activity. The system will collect fines from members if they return books after the due date. Here are the steps for returning a book:

Renew a book: While renewing (re-issuing) a book, the system will check for fines and see if any other member has not reserved the same book, in that case the book item cannot be renewed. Here are the different steps for renewing a book:

Code

Here is the code for the use cases mentioned above:

1. Check-out a book,
2. Return a book, and
3. Renew a book.

Note: This code only focuses on the design part of the use cases. Since you are not required to write a fully executable code in an interview, you can assume parts of the code to interact with the database, payment system, etc.

Enums and Constants: Here are the required enums, data types, and constants:

JavaPython

```
class BookFormat(Enum):
    HARDCOVER, PAPERBACK, AUDIO_BOOK, EBOOK, NEWSPAPER, MAGAZINE, JOURNAL = 1, 2, 3, 4, 5, 6, 7

class BookStatus(Enum):
    AVAILABLE, RESERVED, LOANED, LOST = 1, 2, 3, 4

class ReservationStatus(Enum):
    WAITING, PENDING, CANCELED, NONE = 1, 2, 3, 4

class AccountStatus(Enum):
    ACTIVE, CLOSED, CANCELED, BLACKLISTED, NONE = 1, 2, 3, 4, 5

class Address:
    def __init__(self, street, city, state, zip_code, country):
        self.__street_address = street
        self.__city = city
        self.__state = state
        self.__zip_code = zip_code
        self.__country = country

class Person(ABC):
    def __init__(self, name, address, email, phone):
```

Account, Member, and Librarian: These classes represent various people that interact with our system:

JavaPython

```
# For simplicity, we are not defining getter and setter functions. The reader can
# assume that all class attributes are private and accessed through their respective
# public getter methods and modified only through their public methods function.

from abc import ABC, abstractmethod

class Account(ABC):
    def __init__(self, id, password, person, status=AccountStatus.Active):
        self.__id = id
        self.__password = password
        self.__status = status
        self.__person = person

    def reset_password(self):
        None

class Librarian(Account):
    def __init__(self, id, password, person, status=AccountStatus.Active):
        super().__init__(id, password, person, status)

    def add_book_item(self, book_item):
        None

    def block_member(self, member):
        None
```

BookReservation, BookLending, and Fine: These classes represent a book reservation, lending, and fine collection, respectively.

```

class BookReservation:
    def __init__(self, creation_date, status, book_item_barcode, member_id):
        self.__creation_date = creation_date
        self.__status = status
        self.__book_item_barcode = book_item_barcode
        self.__member_id = member_id

    def fetch_reservation_details(self, barcode):
        None

class BookLending:
    def __init__(self, creation_date, due_date, book_item_barcode, member_id):
        self.__creation_date = creation_date
        self.__due_date = due_date
        self.__return_date = None
        self.__book_item_barcode = book_item_barcode
        self.__member_id = member_id

    def lend_book(self, barcode, member_id):
        None

    def fetch_lending_details(self, barcode):
        None

class Fine:

```

BookItem: Encapsulating a book item, this class will be responsible for processing the reservation, return, and renewal of a book item.

```

from abc import ABC, abstractmethod

class Book(ABC):
    def __init__(self, ISBN, title, subject, publisher, language, number_of_pages):
        self.__ISBN = ISBN
        self.__title = title
        self.__subject = subject
        self.__publisher = publisher
        self.__language = language
        self.__number_of_pages = number_of_pages
        self.__authors = []

class BookItem(Book):
    def __init__(self, barcode, is_reference_only, borrowed, due_date, price, book_format, status, date_of_purchase, publication_date, placed_at):
        self.__barcode = barcode
        self.__is_reference_only = is_reference_only
        self.__borrowed = borrowed
        self.__due_date = due_date
        self.__price = price
        self.__format = book_format
        self.__status = status
        self.__date_of_purchase = date_of_purchase
        self.__publication_date = publication_date
        self.__placed_at = placed_at

    def checkout(self, member_id):

```

Search interface and Catalog: The Catalog class will implement the Search interface to facilitate searching of books.

```

from abc import ABC, abstractmethod

class Search(ABC):

```

```
def search_by_title(self, title):  
    None  
  
def search_by_author(self, author):  
    None  
  
def search_by_subject(self, subject):  
    None  
  
def search_by_pub_date(self, publish_date):  
    None  
  
class Catalog(Search):  
    def __init__(self):  
        self.__book_titles = {}  
        self.__book_authors = {}  
        self.__book_subjects = {}  
        self.__book_publication_dates = {}  
  
    def search_by_title(self, query):  
        # return all books containing the string query in their title.  
        return self.__book_titles.get(query)
```
